CPME policy on health workforce: working conditions, training, planning

Ms Sarada Das, Deputy Secretary General, CPME

2021 CPME policy on health workforce

Key recommendations

- Ensure health workforce planning aims to improve quality of care, patient safety, access to health
- Involve national medical associations in the health workforce planning process
- ensure every national health system is sufficiently robust to educate and train an adequate number of health professionals to meet the future needs <u>without</u> lowering standards of training
- implement ethical recruitment policies in line with the WHO Global Code of Practice on the International Recruitment of Health Personnel
- Account for changing expectations relating to work-life balance and ensure equality in workforce

2021 CPME policy on health workforce

Key recommendations

- benchmarks for minimum workforce capacities
- facilitate doctors' cross-border mobility as a personal and professional right
- pro-actively identify and abolish root causes of such 'push' migration, e.g. economic factors or inappropriate working conditions (e.g. inadequate remuneration, unlawful working hours, lack of technical equipment, unsafe staffing levels, lack of meaningful career development, lack of training opportunities)
- create compensatory mechanisms in case of asymmetric mobility flows
- base task-shifting policies on the objective of improving patient safety and quality of care, not as a cost cutting measure

Supporting the Mental Health of the Health Workforce, from an Opinion by the Expert Panel on effective ways of investing in health (EXPH)

Overview Health Workforce Projects Cluster

Projects	Aim		
AHEAD	Support policy-makers in their decision-making to counteract medical deserts		
TETEOR	Increase job retention in healthcare workers		
OASES	Support health authorities to identify, analyse and mitigate medical deserts		
TRSX.	Provide a novel understanding on task shifting and on transferability and uptake of good practices		
ROUTE HWF	Reduce disparities in population's health within the EU		

Literature review, a first stage in defining a multidimensional definition of a "medical desert (MD)" from AHEAD consortium

Why doing the literature review?

A clear working definition & a set of functional indicators to identify MD
& reasons behind their existence & potential solutions

Method used

- The inclusion criteria
- recent (last 10 years)
- published in top-level databases (PubMed, Cochrane Library)
- local literature, including grey literature from the 5 consortium countries
- a set of mesh terms and free text relevant for the topic of MD

Results (based on 109 articles)

MD is used inconsistently - overlaps with other terms (i.e rurality, isolated areas) and means

•low density of health services in certain areas (including neighboring ones) as compared to population characteristics/needs

•physical distance to the health care (i.e. long travel time to medical facilities).

The new definition:

"Medical deserts imply the inability of a given population to access health services; or the state of isolation in relation to receiving health services, based on quantitative and qualitative barriers, which are interrelated and dependent on each other, in varying degrees and modalities.

Barriers: (1) physical access; (2) social barriers; (3) policy barriers."

The degrees of desertification in a certain area need to be further analysed.

Key ?:

- a. types of critical medical services (country specific) for a given population in a certain area
- a. how to measure distance
- b. and how to indicate & validate desertification

Mirela Mustata, PhD - CHPS, Romania

METEOR Systematic Reviews

WP 4: main findings

Methods:

Systematic reviews following the methodological PRISMA Guidelines, incl quality check

10 years (PUBMED, CINAHL, EMBASE)

First manuscript:

Determinants Influencing Nurses' and Physician's Intention to Leave or to Stay in European Hospitals

Peter de Winter, pediatrician Haarlem/Hoofddorp/Leuven Email: pdewinter@spaarnegasthuis.nl Intentions to leave for European physicians and nurses (% range)

Top 5 Pull factors

Job satisfaction Career developments Good leadership Positive relationships Rewards

Top 5 **Push** factors:

Burnout symptoms No challenges Inadequate staffing Workload Conflicts at work

State of art of desertification in Europe and ways to mitigate desertification

THE HEALTH WORKFORCE **OASES FRAMEWORK**

Availability

Accessibility

Acceptability

Quality

HOW TO MEASURE? → multidimensional

- *Training/supply of the workforce*
- *HWF personal-related factors* .
- *Characteristics of the practice*
- Service system
- Spatial dimensions

The present statistics **do** not support the analysis of desertification. Only rough indicators. Some countries, such as France, have developed indicators to describe medical deserts inside countries, but there are no Europe-wide comparisons available.

Paolo Michelutti, project manager, AGENAS

Literature and State of the art

The academic literature review identified **interprofessional education** as beneficial, **and shared learning** may be more effective in engaging health professionals and facilitating learning

The review of EU projects identified that learning outcomes for task shifting should **enhance teamwork skills, coordination and communication skills**, and the learning activities will **foster interprofessional training** • Has evidence-based knowledge about the condition, diagnosis and treatment

• Has thorough knowledge about relevant qualifications, legislations, guidelines and protocols

Knowledge • Has thorough knowledge about relevant professions, organization of health care, inter-professional practice and culture

Skills

Competency

•Has advanced clinical and decision making skills

Has advanced digital skills

•Has advanced coordination and communication skills

- •Has advanced co-production and team work skills
 - •Has advanced leader and management skills

• Can take part in task delegation and sharing roles within health professions, different health professions, and in shifts to patients or machines

Vibeke Sundling, University of South-Eastern Norway

Empowering EU health policies on Task SHIfting

Results from the ROUTE-HWF literature review

- Different definitions use different characteristics to define if an area is a medical desert
- These characteristics can be divided into <u>5 main categories</u>:
 - Population characteristics
 - Distance to a health facility or health worker
 - Characteristics of the area
 - Population size
 - Characteristics of health workers or healthcare

- There are numerous contributing factors for medical deserts
- Focusing on factors that contribute to the likelihood that professionals want to work in a medical desert, <u>4</u> <u>main categories</u> can be distinguished:
 - Characteristics of the medical workforce
 - Life-style & conditions related factors
 - Work related factors
 - Migration

- Several approaches have been used to mitigate or eliminate medical deserts, but little long-term follow-up studies to judge their effectiveness
- Focusing on professionals and their intention to work in a medical desert, <u>5 main</u> <u>categories</u> can be divided:
 - Undergraduate training
 - Postgraduate pathways and programmes
 - Innovative models of care
 - Planning & Monitoring of the HWF distribution
 - Support & infrastructure

Ronald Batenburg, project manager, NIVEL

Health Workforce Projects Cluster

5 minute break,

Research methodology

contextualization yet comparability of medical deserts across AHEAD countries

CHALLENGES

Benchmarking medical deserts (multidimensionality; specifics for each country)

Significant variation of disaggregated data (or access to) among partner countries

The present context in Europe

APPROACH: from national policies and data analysis to indepth research of medical deserts or areas at risk

1. Identify, collect, and analyze relevant policies and existing (available) statistical data (shared research protocol)

2. Select the medical deserts or areas (localities) at risk of desertification (sampling criteria contextualized by each partner country)

3. Map stakeholders at the national and local level /areas identified as medical deserts or at risk

4. Collect/analyze stakeholders' perceptions regarding medical deserts countrywide (survey protocol adapted by each partner country)

5. Collect/analyze local stakeholders' perceptions and experiences in the identified medical deserts or areas (localities) at risk of desertification (in-depth interview protocol adapted by each partner country)

6. Validate findings through focus-group discussions; policy options at country and EU level

Dana Farcasanu M.D., Ph.D – CHPS, Romania

METEOR will design a cross-sectional online survey to collect data on burnout, mental health, job satisfaction and leaving work.

• SURVEY ON CURRENT WORKERS

Field survey

Target population: current workers of 8 hospitals (one academic and one nonacademic hospital in Belgium, Italy, Netherlands, Poland)

- 50 nurses × hospital ->400 overall
- 45 physicians × hospital -> 360 overall

Domenica Matranga, University of Palermo Email: <u>domenica.matranga@unipa.it</u> ; <u>survey@meteorproject.it</u>

• SURVEY OF FORMER WORKERS

Web Survey

Target population: all European former hospital healthcare workers

• No limit to respondents' enrollment

OASES Promoting evidence-based reforms on medical deserts

Methodologies

- 1. Analysis of factors of desertification at **EU level**
- 2. Measuring medical desert in **local sites**:
 - Spatial accessibility index
 - Spatial taxonomy
- 3. 7 Pilot studies in the **local sites** (consensus building excercise):
 - Cyprus,
 - Finland,
 - France,
 - Hungary,
 - Italy,
 - Moldova
 - Romania.
- 4. Sustainability and scalability recommendations at **EU level**.

Methodologies

	Knowledge Sampling and reviewing a new knowledge base	Process Processing and linking the new and existing knowledge using a cognitive or practice-based framework	Practice Shared learning making practice explicit
	Dissonance	Refinement - Organisation -	Consolidation
	Phase	Feedback phase	phase
	Knowledge	Skills	Competency
Learning	Knowledge-based learning outcomes	Process based learning outcomes	Practice based learning outcomes
outcomes			
Learning	Knowledge test	Case presentations	On-the-job training
activities	Review knowledge	Digital simulation Promote observation, reflection, discussion and tailor feedback	Assessment of practice Promote reflection, discussion, shared learning and feedback
Presentation	Video lectures/ demonstrations	Video cases presentations Digital simulations	Real patients Video recordings from practice
Key resources	Guidelines and protocols Professional qualifications	Guidelines and protocols Professional qualifications	Guidelines and protocols Professional qualifications
Assessment	Formative Self-assessment with pre-prepared feedback	Formative Expert assessment and feedback	Formative or summative Expert judgements

Learning management system and resource repository

Open access to learning and training material
